Utilization of Algorithms, Dynamic Programming Optimization

Date	11 November 2022
Project ID	PNT2022TMID43281
Project Name	Real-time communication system powered by AI for specially A bled
Maximum Mark	2marks

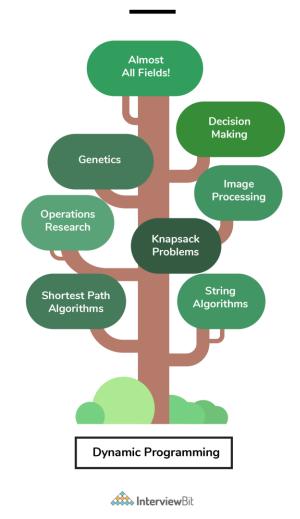

INTRODUCTION

Since its inception in the mid-nineteenth century by "Richard Bellman," dynamic programming (DP) has been successfully applied to a wide range of issues in a variety of areas [1, 2]. One of the most important features of DP is potential to adjust for a structure's dynamics, and it is usually utilized by operations investigators to address problems existence decisions.

DISCUSSION ON THE UTILIZATION OF DYNAMIC PROGRAMMING

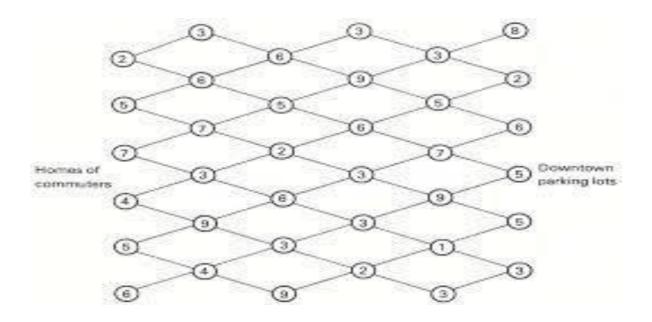

Dynamic programming (DP) is the process which can easily be utilized to solve problems related to scheduling. Many researches executed the dynamic programming in the scheduling problems. Other then scheduling exercises [8]offered process of heuristic solution by implementing dynamic programming to determine the employment of out-sourcing as a mean to overcome the disruptions related to the supply chain in manufacture scheduling for unexpected consumer orders. The while a study conducted by [9]in this study author established a program to schedule surgical procedure at the hospital to reduced time of waiting, overtime in operating room and bed availability in ward.

Applications of Dynamic Programming

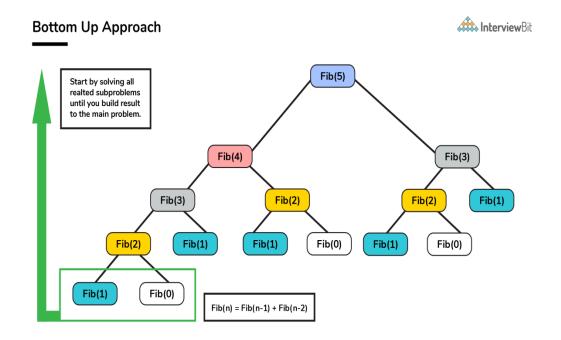

ALGEBRAIC DYNAMIC PROGRAMMING (ADP)

Exact solutions of many problems can be obtained through dynamic programming (DP) algorithms especially in biology computations, more over in sequence alignment, scoring of phylogenetic trees and hidden Markov models (HMMs). Evaluation of distribution of score, performing stochastic sampling and competitions for optimal solutions can be done via structurally analogous algorithms.

DP PROBLEM APPROACHES

According to the researches, the essential element and approximated solutions are determined before the decision rule is being used to make or propose judgments, and when decisions are taken, the algorithm updates its estimate of the problem structure and the ultimate decision rule. Several algorithms which are real time learning based have the benefit of not having precise utility functions for the fundamental inclinations, assumptions, and "laws of motion" that ensures the integrity of the basic problematic situation. An additional notable difference is either the learning is evaluated.

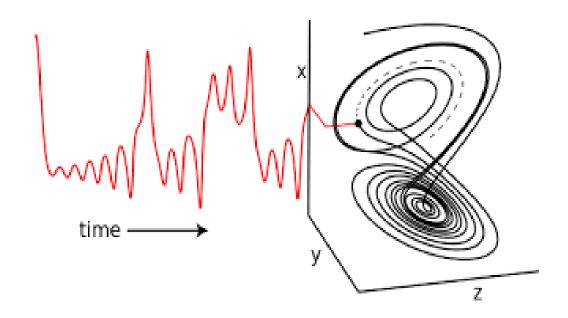

DP APPLICATIONS TO IMPROVE DECISION MAKING

Additional issue that restricts the use of DP is that the target function that many organizations are optimizing is hazy and ambiguous. In economics, the default assumption by government companies is to maximize their market share. This is the expected trickle of future earnings reduced at a riskadjusted discount factor. Conversely, a significant body of financial evidence on the disproportionate stock price volatility market prices poses serious reservations about what the firm's net worth is comparable to its fundamental value, which is the estimated present value of its future income flow.

Smart city lifestyle sensing for well-targeted public health interventions - Process flow diagram Lifestyle public health intelligence Lifestyle sensing Lifestyle geo-analytics Geo-tagged smart city big data Smart dashboards with real-/near-real-time GeoAl and other methods; using evidence-based updates for user-friendly, interactive visualisation public health models, with the possibility of Spatiotemporal big data management: data and decision making - also covers trend learning from big data and updating those models agreements with telecoms and other providers, forecasting and public health programme effect collection interfaces, mash-up (fusion) modules, Real-time processing /cross-linking and analysis of simulations standards (OGC and others), cloud security, privacy, smart city big data stream: Target users: public health policy/decision makers, public health programme managers and their staff City big data sources: real-100 o little time/near-real-time streams. including crowd/citizen sensing data; as well as sources that are less frequently updated, e.g., monthly/quarterly/yearly, etc. Smart public health interventions Formulate well-targeted public health City/neighbourhood lifestyle 'pulse' interventions and 'pulse change' over time · Simulate their effects prior to deployment · After deployment: Continuous real-time (real-time intelligence obtained from monitoring and tweaking of interventions (as big data) necessary) Design well-focused and Monitor city 'pulse' targeted interventions; Continuously assess simulate prior to situation (how well the interventions are doing; Update/refine/optimise is city 'pulse' improving: interventions after can we do better) deployment, as necessary Targeted public health intervention MN Kamel Boulos, 2019-2021

EMPIRICAL DYNAMIC PROGRAMMINGAND THE IDENTIFICATION PROBLEM

The advancements in numerical DP paved the door for a burgeoning literature on empirical estimate and testing of SDPs and dynamic games. The existing knowledge on estimate of dynamic labor demand schedules in a linear quadratic framework began to condense around the end of the 1970s, at the same time as a number of publications appeared that gave diverse methodologies.

CONCLUSION

Dynamic programming (DP) is an exceptionally strong approach for handling a wide range of uncertain sequential decision problems. Indeed, it's difficult to imagine an issue that can't be expressed and solved with Dynamic programming.
